

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application. An identifier indicating the status of each claim is provided.

Listing of Claims:

1. (Currently Amended) A disk drive apparatus ~~having~~ comprising:
a plurality of operation modes,
wherein each of said plurality of operation modes includes a predetermined combination of a disk rotation speed and an error handling mode.
~~wherein said plurality of operation modes include a plurality of operation modes in which disk rotation speeds are different, and~~
~~said plurality of operation modes include a plurality of operation modes in which error handling modes at the time of recording and playback of data are different.~~

2. (Currently Amended) A disk drive apparatus according to claim 1, wherein said disk drive apparatus has:
a first operation mode in which a ~~a~~ the disk rotation speed is set to be low, to which an error handling method appropriate for performing recording or playback of real-time continuous information is made to correspond; and
a second operation mode in which a ~~a~~ the disk rotation speed is set to be high, to which an error handling method appropriate for performing recording or playback of data with high reliability is made to correspond.

3. (Original) A disk drive apparatus according to claim 2, wherein the error handling method in said first operation mode is an error handling method in which an upper limit of an error handling time for realizing recording or playback of real-time continuous information is determined, and

the error handling method in said second operation mode is an error handling method in which an error handling time longer than the upper limit of the error handling time in said first operation mode is permitted.

4. (Original) A disk drive apparatus according to claim 3, wherein in said first operation mode, when error handling is not completed within the upper limit of said error handling time, the error handling is stopped, and a recording or playback process for data which follows is performed.

5. (Original) A disk drive apparatus according to claim 3, wherein the upper limit of said error handling time can be set.

6. (Original) A disk drive apparatus according to claim 2, wherein said disk drive apparatus further has a third operation mode in which a disk rotation speed is set to be high, to which an error handling method appropriate for performing recording or playback of real-time continuous information is made to correspond.

7. (Original) A disk drive apparatus according to claim 2, wherein said disk drive apparatus further has a fourth operation mode in which a disk rotation speed is set to be low, to

which an error handling method appropriate for performing recording or playback of data with high reliability is made to correspond.

8. (Original) A disk drive apparatus according to claim 1, wherein said disk drive apparatus can be battery driven, and when said disk drive apparatus is battery driven, the disk drive apparatus operates in an operation mode in which the disk rotation speed is set to be low.

9. (Original) A disk drive apparatus according to claim 1, wherein said disk drive apparatus can be connected to a host system via a host interface, performs a recording or playback operation onto or from a disk in accordance with a recording or playback command received via said host interface, and switches among different operation modes in accordance with a command containing operation mode specification, which is received via the host interface.

10. (Original) A disk drive apparatus according to claim 9, wherein the command containing said operation mode specification is a command added in accordance with the ATA (AT-Attachment) standard prepared by the ANSI (American National Standards Institute).

11. (Original) A disk drive apparatus according to claim 9, wherein the command containing said operation mode specification is a command added in accordance with the PC card ATA (AT-Attachment) standard defined by the PCMCIA (Personal Memory Card International Association)/JEIDA (Japan Electronics Industry Development Association).

12. (Original) A disk drive apparatus according to claim 1, wherein said disk drive apparatus is a removable disk apparatus from which a mounted disk can be removed.

13. (Original) A disk drive apparatus according to claim 1, wherein the outer dimensions and the connector construction of said disk drive apparatus are in compliance with the PC card standard defined by the PCMCIA/JEIDA.

14. (Original) A disk drive apparatus according to claim 1, wherein said disk drive apparatus performs positioning control of a head with respect to a disk on the basis of servo information in accordance with a sector servo method of sectors provided radially by partitioning the data recording surface of the disk.

15. (Original) A disk drive apparatus according to claim 14, wherein said disk drive apparatus has a synchronous head position detection construction for generating a servo clock on the basis of said servo information recording area and for detecting head position information while referring to the generated clock.

16. (Original) A disk drive apparatus according to claim 1, wherein said disk drive apparatus comprises an information compression unit for compressing information, and an information decompression unit for decompressing compressed information, information compressed by said information compression unit is recorded on a disk loaded into said disk drive apparatus, and when compressed information is played back from the disk, a

decompression process for decompressing information is performed by said information
decompression unit.

17. (Original) A disk drive apparatus according to claim 16, wherein information
compressed by said information compression unit contains moving-image information.

18. (Original) A disk drive apparatus according to claim 17, wherein the moving-
image information is moving-image information compressed by the MPEG2 (Motion Picture
Experts Group Phase 2) method.

19. (Original) A disk drive apparatus according to claim 1, wherein said disk
drive apparatus has a camera for photographing an image, and the image information obtained by
the camera is recorded on a disk loaded in said disk drive apparatus.

20. (Currently Amended) A video camera apparatus comprising:

a disk drive apparatus ~~having~~ comprising:

a plurality of operation modes,

wherein each of said plurality of operation modes includes a

predetermined combination of a disk rotation speed and an error handling mode.

~~wherein said plurality of operation modes include a plurality of operation modes
in which the disk rotation speeds are different, and~~

~~said plurality of operation modes include a plurality of operation modes in which
error handling modes at the time of recording or playback of data are different.~~

21. (Original) A video camera apparatus according to claim 20, wherein said disk drive apparatus has:

a first operation mode in which a disk rotation speed is set to be low, to which an error handling method appropriate for performing recording or playback of real-time continuous information is made to correspond; and

a second operation mode in which a disk rotation speed is set to be high, to which an error handling method appropriate for performing recording or playback of data with high reliability is made to correspond.

22. (Currently Amended) A data processing method for use with a disk drive apparatus having a plurality of operation modes,

wherein each of said plurality of operation modes includes a predetermined combination of a disk rotation speed and an error handling mode, said data processing method comprising the steps of:

setting to a first operation mode in which ~~a~~ the disk rotation speed is set to be low on the basis of mode information contained in a command received by said disk drive apparatus, to which an error handling method appropriate for performing recording or playback of real-time continuous information is made to correspond; and

measuring the duration of error handling for an error which occurs at the time of recording or playback of data onto or from a disk, and when the error handling is not terminated within an upper-limit time contained in said command, stopping the error handling and performing a recording or playback process for data which follows.
